A longitudinal-travel manipulator is a high-efficiency automation system designed to serve multiple injection molding machines aligned in parallel. The robot travels along a linear rail mounted longitudinally across the machines, and deploys individual arms to extract or place products with high speed and precision. Each arm is equipped with vertical (up/down), crosswise (in/out), and rotating axes, all typically servo-driven for flexible and programmable operations. The entire system is centrally controlled and often integrated with MES or SCADA systems for real-time production management, automated sorting, stacking, and palletizing. Compared to individual robot arms per machine, longitudinal-travel systems significantly improve floor space utilization, reduce labor, and increase throughput, making them ideal for high-volume applications in electronics, automotive, and household product manufacturing.

United States market for Longitudinal Travel Manipulator is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Longitudinal Travel Manipulator is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
