A Loss of Resistance (LOR) syringe is a specialized medical instrument used primarily during epidural and spinal anesthesia procedures. It features a unique design intended to help anesthesiologists or healthcare providers identify the correct placement of an epidural or spinal needle. The syringe typically contains air or saline, which when injected, helps the provider detect changes in resistance as the needle enters the epidural or spinal space. This change in resistance, often felt as a sudden loss or decrease in resistance, indicates entry into the desired anatomical space, facilitating accurate placement of anesthesia or analgesia medications. The LOR syringe is a critical tool in ensuring safe and effective regional anesthesia procedures, enhancing patient comfort and minimizing procedural complications.

The global Loss of Resistance (LOR) Syringe market size is projected to grow from US\$ 110 million in 2024 to US\$ 148 million in 2030; it is expected to grow at a CAGR of 5.2% from 2024 to 2030.
