Abstracts

The global Lossy Foam Absorber market size is predicted to grow from US\$ 109 million in 2025 to US\$ 168 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

In 2025, global Lossy Foam Absorber production reached approximately 600 K Sq.m, with an average global market price of around 185 US\$/Sq.m.

Lossy Foam Absorber refers to a lightweight electromagnetic absorbing material made by loading or impregnating polymer foam, such as polyurethane or polyethylene foam, with conductive carbon, graphite, resistive coating or other lossy fillers. It converts incident RF, microwave or millimeter-wave energy into heat through dielectric and resistive loss, thereby reducing reflection, standing waves, cavity resonance and electromagnetic interference. It is widely used in EMC chambers, antenna test rooms, radar testing, automotive millimeter-wave radar validation, RF shielded enclosures and electronic device cavity suppression.

The average single-line production capacity of Lossy Foam Absorber is 23 K Sq.m, the average gross profit margin was 42.2%.

The upstream includes polymer foam substrates, carbon black, graphite, conductive fillers, flame retardants, adhesives, coating chemicals and cutting/molding materials. The midstream mainly consists of absorber formulation, foam impregnation or coating, drying, shaping, pyramidal/wedge/sheet processing, flame-retardant treatment, performance testing and customized assembly. The downstream includes EMC laboratories, antenna test chambers, aerospace and defense electronics, radar systems, telecom equipment, automotive radar testing, satellite communication, RF

shielded rooms and precision microwave measurement facilities.

The cost structure is mainly composed of foam substrate and conductive fillers, accounting for about 35%-45%; processing, coating, cutting and molding costs about 20%-25%; performance testing, quality control and flame-retardant compliance about 10%-15%; labor and customization about 10%-15%; packaging, logistics and installation support about 5%-10%. High-performance chamber-grade products usually have higher testing, formulation and customization costs.

Demand is driven by 5G/6G communication testing, automotive millimeter-wave radar, satellite communications, aerospace and defense radar, EMC compliance laboratories and compact RF devices. Business opportunities are concentrated in high-frequency absorbers, low-reflection anechoic chamber materials, flame-retardant and lightweight products, customized cavity absorbers, and replacement demand from aging EMC chambers and test facilities.
