The global Low-background Multi-channel Gamma Spectrometer market size is predicted to grow from US$ 105 million in 2025 to US$ 145 million in 2032; it is expected to grow at a CAGR of 4.8% from 2026 to 2032.

The low-background multi-channel gamma spectrometer is a highly sensitive nuclear analysis instrument used to accurately measure the energy and intensity of gamma rays in samples with extremely low radioactivity levels. It consists of a high-purity germanium (HPGe) or sodium iodine (NaI:Tl) detector, a multi-channel analysis system, and an ultra-low radioactive background shielding device. It can effectively suppress environmental background interference and realize qualitative and quantitative analysis of natural radionuclides such as uranium, thorium, and potassium in samples such as building materials, food, soil, and water. It is widely used in environmental monitoring, nuclear safety, geological exploration, and radiation protection.In 2024, the global production of low-background multi-channel gamma spectrometers will reach 187,700 units, with an average selling price of US$5,500 per unit, a single-line production capacity of 500 units, and a gross profit margin of 35%.
