The global Low-Code Technology Service market size is predicted to grow from US\$ 2763 million in 2025 to US\$ 12900 million in 2032; it is expected to grow at a CAGR of 25.1% from 2026 to 2032.

Low-code technology services offer a simplified application development approach. Through a graphical user interface and pre-built components, developers and non-technical users can quickly build, deploy, and manage applications with minimal coding. This significantly shortens development cycles, reduces development costs, and promotes business agility and digital transformation. Low-code technology services primarily serve the information technology development and business digital transformation needs of various enterprises, including finance, manufacturing, retail, healthcare, education, government, and public services. Enterprises use low-code platforms to quickly build application systems, automate processes, and implement data management tools, eliminating the need for extensive traditional coding to digitally implement business scenarios. This reduces development costs, shortens launch cycles, and improves business responsiveness. Downstream users include IT departments, business operations teams, and digital transformation project teams within medium and large enterprises. They leverage low-code technology to optimize internal processes, build customer service systems, implement data analysis and visualization, and support the rapid deployment of mobile, web, and cloud applications, driving overall organizational informationization and business agility. The gross profit margin for low-code technology services is 42%.

Low-code technology services are becoming a core driver of enterprise digital transformation. Their advantages lie in significantly shortening application system development cycles, reducing IT labor costs, and improving business responsiveness

and flexibility through visual development and modular components. With the rapidly growing demand for agile development, process automation, and cross-platform applications, low-code platforms can not only support internal business innovation but also help companies quickly deploy customer-facing digital services. In the future, with the further integration of artificial intelligence, automated testing, and cloud-native technologies, low-code technology services will gradually evolve from auxiliary tools to strategic infrastructure for enterprise information construction and business innovation, driving organizations to achieve efficient, agile, and sustainable digital development.
