A Low Differential Pressure Transmitter is a type of sensor used to measure the pressure difference between two points in a system. These transmitters are designed to accurately measure very small changes in pressure, typically ranging from 0.1 to 100 inches of water column (inWC) or equivalent units. They are commonly used in applications such as HVAC systems, clean rooms, and medical equipment, where precise control and monitoring of low pressure differentials is critical. The data collected from these transmitters is often used for process control, monitoring air flow, or ensuring safety and efficiency in various industrial and commercial environments.
