Low-E glass coatings is a form of coating that offers low emissivity. These are applied onto glass surfaces. Furthermore, these coatings help decrease the heat loss by reflecting infrared energy entering the surface. Low-E glass coatings also help decrease the U value, thereby enhancing energy efficiency of the glass. Based on type, the low-E glass coatings market can be segmented into sputtered and pyrolytic. Pyrolytic is mainly used in the production and formulation of low-E glass coatings due to its inherent chemical and mechanical durability. Sputtered coatings use metals, metal oxides, and metal nitrides. They are a bit softer than pyrolytic types. Pyrolytic low-E glass coatings are highly durable, scratch resistant, and can be used for single-glazed applications. Furthermore, these coatings have higher U values compared to sputtered low-E glass coatings..
