Low expansion quartz glass is a special glass material whose main feature is a very low linear expansion coefficient. This glass is usually composed of high-purity quartz and other additives, prepared through special processing and melting. Due to its low expansion coefficient, low-expansion quartz glass performs well in high-temperature deformation and thermal stress, so it is widely used in high-temperature and precision instruments, optical equipment, semiconductor manufacturing and other fields. Low expansion quartz glass usually has excellent thermal stability, optical transparency and chemical stability, and is an important functional glass material.
