Water-saving shower heads – also called low-flow shower heads – restrict the water flow, without making it feel like you're standing under a trickle of water. Standard showerheads use 2.5 gallons of water per minute (gpm), Water-saving showerheads must demonstrate that they use no more than 2.0 gpm. The two main styles of water-saving shower heads are aerating and non-aerating shower heads. Here's how they work: An aerating shower head works by mixing air into the flow of water. By mixing air and water, the volume of water used decreases. The shower becomes a gentle experience that is still capable of delivering a great shower. This aerating shower head works by mixing air with water to reduce the water volume spraying out of the shower head. A non-aerating shower head works by forcing water through smaller openings than a conventional shower head. This delivers a high-pressure shower with less water. A non-aerating shower head delivers a firm shower spray with less water.
