The global Low Free (LF) Isocyanate market size is predicted to grow from US\$ 505 million in 2025 to US\$ 705 million in 2032; it is expected to grow at a CAGR of 5.0% from 2026 to 2032.

Low Free (LF) isocyanate refers to a type of isocyanate product in which the content of free isocyanate monomers is at a relatively low level. Isocyanates generally refer to compounds containing the isocyanate functional group ( $-N = C = O$ ). Under normal circumstances, isocyanate products may contain a certain amount of unreacted isocyanate monomers. However, low - free isocyanates are produced through special manufacturing processes or post - treatment procedures, which significantly reduce the content of free isocyanate monomers in the products. For example, in the preparation of some high - performance polyurethane materials, the isocyanate raw materials are purified and modified to control the content of free isocyanate monomers within a very low range.
