The global Low Free Prepolymer market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Low-free prepolymer is a prepolymer prepared by a special process, in which the content of free unreacted isocyanate monomers is significantly reduced, usually less than 0.1%. This prepolymer can reduce the health and environmental risks caused by high-free isocyanate monomers, especially in coatings, adhesives and elastomer applications, reducing pungent odors and the release of volatile harmful substances. Low-free prepolymer is not only safer and more environmentally friendly, but also maintains high-performance mechanical and chemical properties, and is suitable for use in environments with high requirements for human safety and environmental protection.

United States market for Low Free Prepolymer is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
