The low-frequency PIT tag antenna is a wireless radio frequency device used to read PIT tags. It is widely used in fields such as wildlife tracking, aquaculture, and experimental ecology. The PIT tag itself does not contain a power source and relies on the electromagnetic field emitted by the antenna for activation. When an individual with a PIT tag passes through the antenna sensing area, the tag is activated and returns a unique identification code. The antenna receives the signal and transmits it to the data recording system. This type of antenna is generally composed of a coil and can be installed in waterways, nest box entrances, fence passages, etc., to achieve non-contact, continuous, and automated identification and monitoring of target individuals. It has the advantages of high identification accuracy and strong data traceability.

United States market for Low-Frequency PIT Tag Antennas is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
