The global Low-friction Paint(Low Friction Coatings) market size is predicted to grow from US\$ 526 million in 2025 to US\$ 809 million in 2032; it is expected to grow at a CAGR of 6.5% from 2026 to 2032.

Low-friction paint is a specialized coating formulated with solid lubricants such as PTFE (Teflon), Molybdenum Disulfide (MoS₂), or Tungsten Disulfide (WS₂) to create a dry, solid film on components. This coating significantly reduces the coefficient of friction between surfaces, minimizing wear and energy loss. It is widely used in industries like automotive, aerospace, semiconductors, and marine engineering to enhance efficiency, durability, and performance without attracting dust or debris, unlike liquid lubricants.

In 2024, global Low-friction Paint production reached approximately 2,988 tons, with an average global market price of around US\$170 per kilogram. In 2024, the global 's total production capacity of Low-friction Paint reached 3,931 tons. The industry average gross profit margin of this product reached 24%. The upstream sector consists of raw material suppliers providing resins, solid lubricants (PTFE, MoS₂), and additives. The midstream involves specialized manufacturers who formulate and produce the final coating products. The downstream encompasses various end-user industries, including automotive, aerospace, and industrial equipment manufacturers, which apply these coatings to components like bearings, pistons, and marine hulls .
