Low latency video streaming is a technology that enables the delivery of live video content with minimal delay or lag between the time it is captured and the time it is displayed to viewers. This technology is used in various applications, including online gaming, teleconferencing, live sports events, and other real-time video applications that require high responsiveness and interactivity. Low latency video streaming typically involves the use of advanced compression algorithms and network optimization

techniques to minimize the amount of time it takes for video data to be transmitted from the source to the viewer's device. The goal is to reduce the delay to a level that is imperceptible or minimally perceptible to the viewer, allowing for seamless and near-real time viewing experiences. Achieving low latency video streaming requires a combination of hardware and software optimizations, as well as specialized networking infrastructure designed to minimize latency and ensure high-quality video transmission.
