The global Low-Level Mercury Catalyst market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Low mercury catalyst refers to a catalytic material with relatively low mercury content in the active components of the catalyst. Although mercury is a toxic substance, at appropriate concentrations, it can serve as an effective catalyst component to promote chemical reactions. Low mercury catalysts have the characteristics of oxidation resistance, high temperature resistance, good catalytic activity, and high stability. These properties enable low mercury catalysts to maintain stable catalytic performance in various chemical reactions and industrial production processes.

The foreign PVC market is mainly based on the ethylene method, and low mercury catalysts have almost no market in developed regions such as Europe and America. Therefore, there is not much research on low mercury catalysts abroad. In the early 20th century, countries such as the United States, Japan, Germany, and the former Soviet Union began to study low mercury catalysts; Cerium chloride mercuric chloride catalyst from Monsanto Chemical Company in the United States, and hydrogen chloride mercuric chloride catalyst from East Germany; Although there has been some progress, the service life is too short, only 700 hours, and has little industrial value.
