The global Low Level Wind Shear Alert Systems market size is predicted to grow from US$ million in 2025 to US$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

A Low Level Wind Shear Alert System (LLWAS) is a ground-based system used to detect wind shear and associated weather phenomena, such as microbursts, close to an airport; especially along the runway corridors. This information can then be passed, in real-time, to warn pilots and aerodrome services.Low Level Wind Shear is defined as a sudden change of wind velocity and/or direction in either the vertical or horizontal planes. At low level, i.e. when aircraft are departing from or landing at an aerodrome, wind shear can present a severe risk to flight safety. Therefore, timely warnings are essential to help pilots respond appropriately.

According to the IATA, the total volume of air passenger traffic in 2022 increased by 64.4% compared to 2021. Global passenger traffic for the whole year was 68.5% of pre-pandemic (2019) levels. Total global aviation revenue grew by 43.6% to $727 billion in 2022. In 2022, global airlines were expected to have a net loss of $6.9 billion, significantly better than the net loss of $42 billion in 2021 and $137.7 billion in 2020. According to data from the Civil Aviation Administration of China, in 2022, the cumulative operating income of the entire industry was 632.89 billion yuan, down 15.8% from the previous year. The loss was 217.44 billion yuan. Among them, airlines achieved operating income of 336.48 billion yuan, and the loss was 177.12 billion yuan. The airport achieved operating income of 77.01 billion yuan and the loss was 47.62 billion yuan.
