The global Low Platinum Catalyst market size is predicted to grow from US\$ 199 million in 2025 to US\$ 543 million in 2032; it is expected to grow at a CAGR of 15.5% from 2026 to 2032.

Low-platinum catalysts refer to Pt-based catalysts with low platinum content per unit power or per unit catalyst in fuel cells, while maintaining high catalytic activity and long-term durability. They are primarily used in hydrogen fuel cells (such as PEMFC cathodes). By optimizing Pt particle size, loading, support structure, and surface treatment, low precious metal usage is achieved without significantly reducing performance. Low-platinum catalysts can employ Pt/C, Pt Alloy/C, or core-shell Pt technologies, representing a core technological direction for driving fuel cell commercialization and reducing system costs. In 2025, global shipments of low-platinum catalysts were approximately 5.6 tons, with a unit price of approximately US\$36,400/kg and a gross profit margin of approximately 4.86%-15.3%.

The rapid development of new energy vehicles, stationary power generation, and portable hydrogen energy devices is driving the continued growth in demand for high-performance low-platinum catalysts. Low-platinum catalysts can significantly reduce the amount of precious metals used in PEMFC cathodes while improving power density and durability, representing a crucial breakthrough for cost control and commercialization. Policy support, carbon neutrality goals, and fuel cell vehicle subsidies continue to drive market expansion.

Platinum resources are limited and expensive, and the preparation of low-platinum catalysts requires sophisticated technology, necessitating assurance of Pt particle dispersion, uniform loading, and long-term stability. The research and development of

non-precious metal catalysts may also create competitive pressure in the future.

Automotive fuel cells remain the primary application for low-platinum catalysts, holding a dominant market share; stationary power generation, backup power, and portable hydrogen energy devices represent a stable growth market. Future trends indicate that low-Pt high-MA catalysts, Pt Alloy/C, and core-shell Pt catalysts will gradually replace traditional high-Pt products, making technological upgrades the core of market competition.
