The global Low Pressure Ceramic Injection Molding market size is predicted to grow from US\$ 226 million in 2025 to US\$ 386 million in 2032; it is expected to grow at a CAGR of 8.1% from 2026 to 2032.

Powder injection moulding (PIM) uses sinterable powders to manufacture very intricate components. Unlike traditional press-and-sinter powder metallurgy processes, PIM could potentially allow the economic mass production of dense, net-shaped metal, ceramic and cermet components. These can be geometrically intricate and be produced to close dimensional tolerance. Low pressure injection moulding is a variation on PIM, and varies in that materials can be injected into the mould at low pressures. Low viscosity compositions can be made from wax-based binders, and these can be easily processed at low injection pressures. Injection Molding of ceramics is also similar to the processes used for other materials. Injection molding is used mainly for very intricate or high volume components. The cost for injection mold tooling is expensive but when amortized across high volumes it can mean a lower per part cost. The LPIM process enables fabrication of very complex shapes as well as simpler components. The essence of the process is that parts can be produced with a higher level of integrated function to meet the customers needs than other processes are able to achieve.
