A low pressure steam generator is a device designed to produce steam at lower pressures than traditional boilers, typically operating between 15 to 150 psi (pounds per square inch). These generators are commonly used in various industrial applications where steam is required for heating, humidification, cleaning, sterilization, and other processes. Unlike high-pressure steam boilers, which operate at pressures exceeding 15 psi, low pressure steam generators are often more compact, cost-effective, and suitable for smaller-scale operations or facilities with specific steam pressure requirements. They utilize water and a heat source, such as electricity or gas, to generate steam through controlled heating and vaporization processes. Low pressure steam generators are valued for their efficiency, safety features, and versatility in providing a reliable source of steam for diverse industrial applications.

The global Low Pressure Steam Generator market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
