The global Low Range Radio Altimeter market size is predicted to grow from US\$ 160 million in 2025 to US\$ 204 million in 2032; it is expected to grow at a CAGR of 3.6% from 2026 to 2032.

The low range radio altimeter is an airborne radio device used to measure the vertical distance from the aircraft to the ground, with a measurement range of 0-2,500 feet. It calculates the actual height of the aircraft from the ground by transmitting FM signals and receiving signals reflected from the ground, and transmits the data to other related systems of the aircraft for display and use. The low-altitude radio altimeter is mainly used in the takeoff and landing phases of the aircraft, especially in low visibility and automatic landing conditions. It can provide accurate ground height information to help pilots land safely.
