Low rolling resistance tires are designed to improve fuel efficiency and reduce energy loss as a vehicle moves. Rolling resistance itself is a force that opposes the motion when an object rolls along a surface. In the context of tires, it refers to the energy that your vehicle needs to send to your tires to maintain movement at a constant speed over a surface. The lower the rolling resistance, the less energy (or fuel) is needed for a car to move and maintain speed, which can lead to significant savings in fuel costs and reductions in greenhouse gas emissions.

The global Low Rolling Resistance Tires market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
