The low-speed unmanned vehicle chassis is the core hardware platform that supports the autonomous mobility of unmanned vehicles. It integrates power, steering, braking, suspension and other systems, and replaces traditional mechanical connections with wire control technology (electrical signal control) to achieve precise control of the vehicle. Its maximum speed is usually less than 50 kilometers per hour, suitable for closed or semi-closed scenes. Steering, braking, etc. are controlled by electrical signals to support real-time instructions of unmanned driving algorithms. The chassis is separated from the upper body (such as cargo boxes, cleaning equipment), which is convenient for quick adaptation to different application scenarios.
