The global Low-Stress Encapsulation Adhesive market size is predicted to grow from US\$ 562 million in 2025 to US\$ 935 million in 2032; it is expected to grow at a CAGR of 7.6% from 2026 to 2032.

Low-stress encapsulation adhesive is a functional electronic adhesive used for protecting the packaging of chips, power modules, sensors, optoelectronic devices, and printed circuit board assemblies. It typically uses low-modulus, low curing shrinkage, low thermal expansion, or gel-forming formulations to mitigate thermomechanical stress between chips, substrates, solder joints, wire bonds, and housings. The overall gross margin is approximately 45%.

The demand for low-stress encapsulation adhesives primarily comes from reliability upgrades in semiconductor packaging and automotive electronics. As chip sizes increase, substrates become thinner, heterogeneous integration advances, and power devices operate at higher temperatures, thermal expansion mismatch between materials is more likely to translate into warpage, interfacial cracking, and solder joint fatigue. As a result, customers are increasingly willing to pay a premium for specialty adhesives with low modulus, low shrinkage, low ionic contamination, and controllable flow properties.

On the supply side, competitive focus is shifting from single bond strength to a comprehensive balance of formulations. Epoxy systems still dominate due to their strength, heat resistance, and process window advantages; silicone and gel systems are more prominent in stress buffering, thermal cycling, and power modules; UV-curable and dual-curing systems are suitable for high-speed dispensing and local encapsulation. The main barriers for leading companies lie in customer qualification

cycles, failure databases, batch-to-batch consistency, and coordination with dispensing equipment and packaging processes.

Future growth will be concentrated in advanced packaging, automotive-grade power modules, sensor modules, optoelectronic devices, and high-reliability PCB protection. Domestic manufacturers have opportunities to substitute imports in mid-to-high-end potting compounds, underfills, and thermally conductive low-stress adhesives. However, they still need continuous accumulation in low-warpage, low-ionic-content materials and long-term reliability data for advanced packaging applications.
