The low-temperature buffer check valve is a one-way valve specially designed for low-temperature environments, mainly used to prevent the backflow of media. It effectively reduces the impact and vibration of the media under low-temperature conditions through the built-in buffer device, protecting the pipeline system from damage caused by sudden temperature changes. This valve is usually used in pipeline systems with special working conditions such as liquefied gas, natural gas, and cryogenic fluids to ensure that the fluid only flows in the predetermined direction, while reducing the impact of temperature changes on valve performance.
