The global Low-Temperature Curing Thermally Conductive Silver Paste market size is predicted to grow from US\$ 343 million in 2025 to US\$ 519 million in 2032; it is expected to grow at a CAGR of 6.1% from 2026 to 2032.

Low-temperature curing thermally/electrically conductive silver paste is a functional paste that uses silver flakes, powders, or nano-silver as the conductive and thermal phase, dispersed in a resin/solvent/additive carrier, and forms a continuous conductive/thermal network at typically below 150°C, or in a broader industrial sense below 250°C. It is used for heat-sensitive substrates and high-reliability assemblies such as PET/PI circuits, LTCC, semiconductor packaging, flexible electronics, automotive electronics, and some next-generation PV cells.

The upstream supply chain is centered on silver powder or nano-silver, resin/hardener systems, solvents, dispersants, and rheology modifiers. Midstream value creation comes from formulation, dispersion, viscosity/thixotropy control, printability or dispense performance, and long-term reliability qualification. Downstream demand comes mainly from semiconductor packaging, LEDs, printed electronics, sensors, photovoltaics, and automotive electronics.

In 2025, global Low-temperature curing thermally conductive silver paste production reached approximately 700 tons, with an average global market price is \$500 per kg.
