The global Low Temperature Hammer Cyclone Mill market size is predicted to grow from US$ 662 million in 2025 to US$ 890 million in 2031; it is expected to grow at a CAGR of 5.1% from 2025 to 2031.

The low-temperature hammer cyclone mill is a device that integrates crushing, mixing and homogenization. It uses high-speed rotating hammers to impact, shear and grind the sample to the required particle size. At the same time, the equipment is equipped with a low-temperature control system. Through built-in low-temperature control, such as compressor-type cooling technology or built-in low-temperature environmental cooling device, the temperature in the crushing chamber is monitored and adjusted in real time to ensure that the temperature of the sample will not be too high during the crushing process. Low-temperature hammer cyclone mills are widely used in occasions where samples need to be crushed at low temperatures, especially in the grain industry. Low-temperature hammer cyclone mills are widely used in the crushing of small and medium-sized particle samples such as wheat and rice to meet the sample preparation and various index determination and analysis requirements for gluten quantity, quality determination, falling number, near-infrared component analysis, grain viscosity and other fineness requirements.
