Low-temperature pure milk typically refers to milk that has been processed and stored at lower temperatures to maintain its freshness and extend its shelf life. This is often achieved through a process called 'ultra-pasteurization' or 'ultra-high-temperature (UHT) pasteurization.'

In recent years, as a result of extensive research into the development of low-temperature pure milk, low-temperature pure milk is a type of milk product that has been specially treated to retain more of its natural nutrients and flavour. It is usually pasteurised at low temperatures ranging from 60°C to 85°C to kill the majority of bacteria but retain more enzymes and vitamins. The low-temperature pure milk market continues to grow globally. Rising consumer demand for healthier and more natural

dairy options is fuelling the expansion of this market. Consumers' health and nutritional concerns have fuelled the demand for low-temperature pure milk. This milk is considered healthier as it usually contains more active enzymes and vitamins as compared to high temperature pasteurised milk. Packaging plays a key role in the low-temperature pure milk market. New packaging technologies can extend the shelf life of the product and ensure freshness and quality. Overall, the low-temperature pure milk market is constantly evolving and innovating to meet the demands of modern consumers for healthier, more sustainable, and tastier dairy products. The future of this market is likely to include more product diversity, smarter packaging technologies, and wider global expansion.
