The global Low Temperature Thermoplastic Board market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Low temperature thermoplastic board is a special synthetic high molecular polyester, a new type of medical material processed by a series of physical and chemical methods. Its molecules are in a stable state in a dry environment at room temperature (10?-30?), and can be softened after heating in 65-70? water for 1-3 minutes, and can be hardened in 3-5 minutes at room temperature. Because this material has outstanding properties such as non-absorption of radiation, good shaping effect after heating and softening, and unique shape memory function (when the shaping is not satisfactory, it can be heated again, reshaped or locally heated and reshaped), as well as simple operation and convenient fixation, it is currently an ideal external fixation material for radiotherapy positioning and orthopedic fixation.

United States market for Low Temperature Thermoplastic Board is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
