Low temperature vacuum spray drying machine is a type of equipment used for the drying of liquid or semi-liquid materials in a low temperature and vacuum environment. It consists of a chamber or vessel where the material to be dried is sprayed in a fine mist form, and a vacuum system that facilitates rapid evaporation of moisture.

The machine operates by creating a low-pressure environment inside the chamber, which lowers the boiling point of the liquid or semi-liquid material. The material is then

atomized into droplets using a spray nozzle or atomizer, allowing for an increased surface area to enhance the drying process.

Under the vacuum condition, the sprayed droplets quickly lose moisture as the low temperature causes the water to evaporate. This results in the formation of dry particles or powders, which are then collected for further processing or packaging.

Low temperature vacuum spray drying machines are commonly used in industries such as food, pharmaceuticals, chemicals, and biotechnology, where it is necessary to carefully dry heat-sensitive materials without causing degradation or loss of potency.
