The global Low TOC Polishing Resin market size is predicted to grow from US\$ 135 million in 2025 to US\$ 183 million in 2032; it is expected to grow at a CAGR of 4.5% from 2026 to 2032.

Low-TOC (Total Organic Carbon) polishing resins are primarily utilized for the final purification stage in ultrapure water systems, enabling the deep removal of trace dissolved ions and organic substances from water. Distinguished by their exceptionally low levels of impurity leaching, they serve as a critical material for ensuring that the quality of the final process water meets ppt (parts per trillion) or ppb (parts per billion) standards.

The upstream supply chain for low-TOC polishing resins primarily comprises styrene, divinylbenzene, acrylic monomers, porogens, cross-linking agents, sulfonating agents, amination agents, regeneration acids and bases, and high-purity water. The midstream segment encompasses the polymerization, functionalization, deep regeneration, ultrapure cleaning, low-TOC treatment, metal ion control, and particle size classification of high-purity cation resins, anion resins, and mixed-bed resins; the core value in this stage lies in the control of low leachables, batch-to-batch consistency, and semiconductor-grade validation capabilities. Downstream, these resins are primarily integrated into ultrapure water generation systems to remove residual ions, silicon, boron, metal ions, and trace organic impurities, thereby ensuring that the water quality meets the stringent cleanliness requirements of wafer cleaning, wet etching, lithography, and display panel manufacturing processes.

In 2025, the global sales volume of low-TOC polishing resins is projected to reach approximately 15,000 cubic meters, with an average price ranging from \$8,000 to

\$10,500 per cubic meter. Leading manufacturers in the industry typically maintain gross margins of approximately 35% to 50%.
