The global Low Water Peak Fiber market size is predicted to grow from US\$ 3261 million in 2025 to US\$ 4647 million in 2032; it is expected to grow at a CAGR of 5.3% from 2026 to 2032.

The development of low water peak fiber is that with the rapid development of information technology, the demand for optical fiber as the main carrier of information is also increasing. After the bursting of the Internet bubble, optical fiber manufacturers have gradually shifted their focus to the metropolitan area network. Low water peak optical fiber has gradually been recommended by experts as the best choice for metropolitan area network optical fiber. Since a few OH ions will inevitably appear in the manufacturing process of optical fiber, the optical fiber absorbs energy at a specific 1383nm resonant frequency and causes attenuation, which is what we often call water peak. Low water peak optical fiber refers to the original optical fiber. By precisely controlling the OH ion content and compressing the water peak of the 1383nm window, the wavelength range is expanded from 1260nm to 1625nm, thereby reducing the energy absorption and attenuation at a specific frequency, so that the optical fiber has higher transmission performance and stability in the metropolitan area network.

United States market for Low Water Peak Fiber is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
