## Abstracts

The global Lower Incisor Human Tooth Models market size is predicted to grow from US\$ 117 million in 2025 to US\$ 166 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

In 2025, global Lower Incisor Human Tooth Model production reached approximately 0.796 M Units. The average price is approximately \$150. Lower Incisor Human Tooth Model is a dental anatomy teaching and demonstration model made according to the actual anatomical proportions of the human mandibular incisors (usually the mandibular central or lateral incisors). This model is typically made of resin, PVC, composite materials, or 3D printing materials, and reproduces the external morphology and internal structure of the tooth by magnification (commonly 5-10 times) or actual size. It is used to demonstrate anatomical features such as the crown, neck, root, dentin, pulp chamber, root canal, and periodontal structures.

## Gross Profit Margin Level

Lower incisor models generally fall into the category of educational and medical display equipment, characterized by medium-to-high gross profit margins, small batch production, and diverse product categories. Leading international brands typically achieve higher gross profit margins due to their anatomical accuracy, durability, brand premium, AR/digital content bundling, and global distribution. Meanwhile, many manufacturers in China and India primarily focus on OEM/ODM, standardized molds, and export orders, offering more flexible pricing but lower unit prices. Considering the industry's price structure and material characteristics, the raw materials for these products are not expensive at the factory level. The main costs are concentrated in mold development, manual painting/assembly, channel distribution, packaging and

logistics, and small-batch inventory management. Therefore, the industry's average gross profit margin is usually higher than that of general low-end teaching consumables. I tend to estimate that the gross profit margin for general-purpose products is mostly between 35% and 45%, while for mid-to-high-end anatomical teaching models it is around 45% to 60%, and for high-end individual models from international brands, it can be even higher at the retail level. In other words, this is not a low-margin industry that relies on high volume, but rather a niche educational equipment market where profits are supported by precision, educational value, and brand trust.

## Industry Drivers

The growth of the lower incisor dental model market is not primarily driven by an increase in the number of dental models themselves, but rather by the upgrading of global dental education and patient communication methods. Firstly, dental schools, vocational education institutions, and oral training organizations are increasingly emphasizing simulation training, repeatable operations, and standardized teaching, directly increasing the demand for individual dental models, detachable dental models, and root canal visualization models. Secondly, the high incidence of oral diseases and the widespread use of orthodontic and restorative treatments make hospitals and clinics more reliant on models for explaining treatment plans, informing patients of risks, and educating patients. Thirdly, the introduction of 3D printing, transparent resin, multi-material composites, and digital anatomical content has upgraded models from 'static displays' to 'semi-digital teaching tools,' increasing product price and update frequency. On the supply side, the mature export capacity of Chinese and Indian manufacturers further pushes products to schools, clinics, and public health institutions worldwide. Therefore, the growth of this market in the coming years is more likely a result of the combined forces of upgraded dental education, increased oral health awareness, and low-cost global supply expansion.
