LTCC is a multilayer ceramic technology, resembling organic printed circuit boards. A typical module consists of a number of ceramic layers with printed conductors and other integrated passive components. The sheets are laminated and co-fired at 850 °C to form a multilayer interconnection substrate. Cavities and other kind of mechanical structures enabled by processing the substrate in soft state makes the LTCC a true 3D-substrate technology. LTCC combines the good properties of inorganic materials and high wiring density of a multilayer structure.

LTCC substrate can be post processed using conventional thick film processes for example for additional layers and patterns. Fine line printing methods can be used to achieve the best line definition.

The global LTCC for RF Application market size is projected to grow from US\$ 1493 million in 2024 to US\$ 2102 million in 2030; it is expected to grow at a CAGR of 5.9% from 2024 to 2030.
