LTCC bandpass filter (BPF) is a bandpass filter based on low temperature cofired ceramic (LTCC) technology. The bandpass filter (BPF) itself is a device that allows waves in a specific frequency band to pass while shielding other frequency bands. Specifically for LTCC bandpass filters, it combines the advantages of LTCC technology to bring higher performance and application value to the filter. LTCC is a multilayer ceramic substrate technology, which is made by co-firing multiple layers of ceramic materials at high temperatures. It has the advantages of high precision, high integration, high performance and low cost. This technology is widely used in communications, automotive electronics, aerospace and other fields. BPF is a filter that can pass frequency components within a certain frequency range while attenuating frequency components in other ranges to extremely low levels. Unlike low-pass filters (LPFs) and high-pass filters (HPFs), BPFs have more specific frequency selection characteristics. The LTCC bandpass filter combines the high integration and high performance characteristics of LTCC technology with the specific frequency selection characteristics of the bandpass filter. This makes it have broad application prospects in high-frequency communications, RF front-ends and other fields.

The global LTCC Band-pass Filter (BPF) market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
