LTCC green tape refers to the unfired ceramic sheet used as a core substrate material in low temperature co-fired ceramic (LTCC) technology. It is produced by mixing ceramic powders (e.g., alumina, quartz, titanates) with glass frits and organic additives such as binders, plasticizers, and dispersants, followed by tape casting or calendaring processes. The resulting tape typically ranges in thickness from 20 μm to 200 μm and serves as the foundational layer for building multilayer ceramic structures. Depending on the dielectric characteristics and sintering profile, LTCC green tapes can be categorized into standard (850°C sintering), low-temperature (below 750°C for Ag conductor compatibility), high-dielectric ($\epsilon_r > 20$), and low-dielectric (ϵ_r

With the increasing demand for high-frequency, high-integration, and miniaturized systems, LTCC green tape technology is evolving in several key directions. Firstly, low-loss and high-frequency performance is a priority, requiring ultra-low dielectric loss (D_f LP Information, Inc.
