## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

LTCC high-pass filter (HPF) corresponds to low-pass filter (LPF). It is a filter that allows frequency signals above a certain cutoff frequency (or called cutoff frequency) to pass, while greatly attenuating or preventing frequency signals below the cutoff frequency from passing. LTCC high-pass filters take advantage of the LTCC technology and integrate components such as inductors and capacitors in monolithic ceramics through multi-layer printing to achieve the filtering function of high-frequency signals. LTCC materials have excellent high-frequency characteristics, allowing LTCC high-pass filters to maintain good filtering performance in the high-frequency band. LTCC technology achieves a high degree of integration of filter components through multi-layer printing and sintering processes, greatly reducing the size of the filter and making the structure more compact. The internal components of the LTCC filter are tightly wrapped by ceramic materials and have high resistance to vibration, impact and high temperature, thereby improving the reliability and stability of the filter. LTCC technology allows designers to flexibly adjust the circuit structure and component parameters of the filter according to actual needs to achieve specific filtering effects.

The global LTCC High-pass Filter (HPF) market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
