LTCC low-pass filter (LPF) is an electronic filter made using LTCC technology. Its characteristic is that it allows signals below a certain cutoff frequency to pass through, while signals above the cutoff frequency are attenuated or blocked. This filter plays an important role in signal processing, data transmission and interference suppression through its unique frequency response characteristics. The working principle of LTCC low-pass filter is mainly based on the characteristics of the reactance of capacitors and inductors changing with frequency. When the signal passes through the filter, the low-frequency signal can pass smoothly due to its small reactance, while the high-frequency signal is attenuated or blocked due to its increased reactance. Specifically, the cutoff frequency of the filter is an important parameter that determines the filter's ability to suppress high-frequency signals.
