Lubricants are essential for proper functioning of any machinery used in an application. Lubricants are used to reduce friction between two moving surfaces. A lubrication system does not eradicate friction from the machinery. Friction is required for transfer of power from one part to another. A lubrication system is employed to lower the wear and tear in the operating machinery.

Advancements in technology have led to development of several controlling and monitoring systems, which assist in proper lubrication of various machineries or units. These systems are further enhancing the reliability and performance of lubrication systems by providing lubrication at proper intervals and in correct quantities. Several methods and processes are employed to lubricate a machine. Lubrication can be

carried out by using manual lubrication systems or centralized/automatic lubrication systems.
