Luciferase reporter gene plasmid is a molecular biology tool used to study gene expression regulation. By combining the luciferase gene with a specific promoter or regulatory sequence, the luminescence intensity can be used to reflect the gene expression activity after transfection into cells. This plasmid structure usually includes a reporter gene, a promoter, a multiple cloning site, a selection marker, and a replication origin. It is flexible in operation and widely used in signal pathway analysis, promoter activity detection, drug screening and other fields.

With the development of synthetic biology, gene editing and high-throughput screening technology, the luciferase reporter gene system is evolving towards higher sensitivity, lower background, smaller size and multiple reporting functions (such as dual luciferase system). Future trends also include integration with CRISPR, AI image analysis, single-cell sequencing and other technologies to achieve more accurate and dynamic gene expression regulation research.

United States market for Luciferase Reporter Gene Plasmid is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
