The global Lufenuron market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

Lufenuron is an insect growth regulator that controls flea infestations in dogs, cats, rabbits, and ferrets. It is frequently found in combination with other medications such as milbemycin and/or praziquantel. Lufenuron works as a growth inhibitor. Therefore, the adult flea must feed on a treated animal to ingest the drug, and any eggs produced by this adult will not survive. It does NOT kill adult fleas nor does it repel fleas. Because the effects are targeting offspring, the overall flea control effects can take several months. Therefore, this medication works better in combination with other products for long-term control as opposed to a sole therapy.
