Transcatheter bronchial arterial chemoembolization is a minimally invasive operation. To put it simply, in the case of no operation, a tiny channel with a diameter of about 2 mm is made on the skin. Under the guidance of angiography machine, the tumor blood supply vessels are found and then the chemotherapy drugs are infused through the catheter, and then the tumor blood vessel is embolized with embolization agent to block the tumor blood supply. For the tumor is to kill (high concentration of anticancer drugs) + 'starve to death (blocking tumor blood vessels) double treatment of the tumor, the local lesions for the least trauma treatment method.
