A contactor is an electrically-controlled switch used for switching an electrical power circuit. A contactor is typically controlled by a circuit which has a much lower power level than the switched circuit, such as a 24-volt coil electromagnet controlling a 230-volt motor switch.

In addition to their current ratings and rating for motor circuit control, contactors often have other construction details not found in relays. Unlike lower-powered relays, contactors generally have special structures for arc-suppression to allow them to interrupt heavy currents, such as motor starting inrush current. Contactors usually have provision for installation of additional contact blocks, rated for pilot duty, used in motor control circuits.

The industrial sector has been evolving rapidly with the continual introduction of sophisticated technologies such as robotics, artificial intelligence, and more. Additionally, the automation enables swift operations of manufacturing and material handling with the use of intelligent manufacturing infrastructure. Industries are deploying industrial automation and control systems in an attempt to increase productivity and reduce labor costs. Moreover, with the advent of Industry 4.0, the manufacturing sector

has been experiencing rapid adoption of new systems and augmented networking architectures, which is projected to provide significant opportunities for market growth.
