Lymphangiomyomatosis (LAM) is a rare lung disease that affects mostly women of childbearing age (the years between puberty and menopause when it is possible to become pregnant). In people who have LAM, abnormal muscle-like cells begin to grow out of control in the lungs and other parts of the body. Over time, these LAM cells can destroy healthy lung tissue. As a result, fluid-filled pockets called cysts may develop, preventing air from moving freely in and out of the lungs. This can lower the amount of oxygen that reaches the rest of the body.

The global Lymphangiomyomatosis (LAM) market size is projected to grow from US\$ 147 million in 2024 to US\$ 206 million in 2030; it is expected to grow at a CAGR of 5.7% from 2024 to 2030.
