Vasopressin (AVP), also known as posterior lobe vasopressin or antidiuretic hormone, is a cyclic peptide hormone produced by the supraoptic nucleus neurons of the hypothalamus. Vasopressin is mainly used in clinical practice for the treatment of diabetes insipidus and esophageal variceal bleeding, as well as for the differential diagnosis of central diabetes insipidus, renal diabetes insipidus, and psychogenic thirst. Lysine vasopressin colorless transparent solution with pH 3.7-4.3, containing buffering agent sodium acetate, antibacterial agent trichloromethyl tert butanol, and sodium chloride. It has various biological activities of natural vasopressin, and the antidiuretic effect of each unit of vasopressin is equivalent to half of that of human vasopressin. Its vasoconstrictive properties only manifest when high doses are administered. The action time is shorter than that of diabetes insipidus cessation, only about 4 hours.
