The report requires updating with new data and is sent in 48 hours after order is placed.

According to this study, the global Machine Intelligence market size will reach US\$ million by 2030.

Machine intelligence is an extension of the new generation of automation, used to assist humans, change the nature of work, and make work more efficient. The basis of machine intelligence is computing, and the core is a machine that can learn, which brings humans into an intelligent society. Machine intelligence imitates many human abilities:

1. Perception, such as AI's visual function and image recognition ability;
2. Mobility, allowing the machine to act like a human, such as handling object handling tasks in a variety of different situations;
3. Human IQ, based on the research of network models and algorithms, uses artificial neural networks to form practical application systems. When a machine has human IQ and can think and handle problems like a human, this is also a high degree of artificial intelligence;
4. Creativity. Creativity is actually the ability to learn. If a machine wants to have the ability to learn and create like a human, it also needs to learn. We call it "deep learning." The motivation is to build a neural network that can simulate the human brain for analytical learning. It imitates the mechanism of the human brain to interpret data.
