Mechanical perfusion (MP) is a new method of organ preservation and transport. Organ acquisition connects its own blood vessels to the organ mechanical perfusion system. During the organ preservation and transport stages, the system continues to perfuse the isolated organ with perfusion fluid and supplies it at the same time. Isolated organ oxygen, nutrients, etc. Compared with traditional static cold storage (SCS), MP can better preserve isolated organs and even save standard external organs. According to different maintenance temperatures, it can be divided into low temperature (4~6?), mild hypothermia (20~25?), and normal temperature mechanical perfusion (37?).
