The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

A machine sensor is a detection device that can sense the information being measured, and can transform the sensed information into electrical signals or other required forms of information output in accordance with a certain rule to meet the information transmission, processing, storage, Display, record and control requirements.

Computer-controlled complex machines have functions similar to human limbs and senses, flexible motion programs, and a certain degree of intelligence, and can be independent of human manipulation during work. Machine sensors play a very important role in the control of machines. It is because of the sensors that robots have human-like perception functions and reaction capabilities.
