The report requires updating with new data and is sent in 48 hours after order is placed.

Machine vision (MV) systems use one or more video cameras, digital signal processing and analog to digital conversion to allow a computer to observe, inspect and scrutinize task performance. The data is subsequently sent to a computer, which analyses it and generates the desired output. Any machine vision system must have both high resolution and sensitivity. Resolution is responsible for distinguishing between things, whereas sensitivity refers to the machine's ability to detect objects or weak signals in dim light or at wavelengths invisible to the naked eye.
