The global Machine Vision Laser market size is predicted to grow from US\$ 158 million in 2025 to US\$ 309 million in 2032; it is expected to grow at a CAGR of 10.0% from 2026 to 2032.

Machine Vision Lasers are laser light sources (or laser projectors/line-laser modules) engineered specifically for machine-vision imaging, measurement, alignment, and 3D reconstruction. They project spots/lines/crosshairs/multi-lines/grids/structured patterns onto targets so cameras can perform 2D alignment, edge/contour extraction, laser triangulation, light-sectioning, 3D reconstruction, and guidance. In harsh environments (e.g., hot metal, welding glare, extreme motion), pulsed laser illumination can deliver high-contrast images where conventional light sources struggle. In 2025, global Machine Vision Lasers production reached approximately 824.85 k units. Upstream, machine vision lasers are built on laser diode emitters (LD/VCSEL and their packages), precision optics (collimators, Powell lenses for uniform lines, and diffractive optical elements for structured patterns), electronics (constant-current drivers, modulation/pulsing and camera-sync I/O), and robust mechanical/thermal design (heatsinking, sealing, IP protection, connectors and cabling). Downstream, these products are consumed by 3D metrology and inspection systems (laser triangulation and light-sectioning for contour/geometry), 2D alignment and robot guidance, logistics dimensioning and inline inspection, electronics/semiconductor precision positioning, and harsh-process monitoring such as welding/hot metal imaging where pulsed laser illumination can suppress thermal radiation and motion blur.

Machine vision lasers?typically spot/line/structured-light projectors?enable calibrated active illumination for 2D alignment and 3D metrology (laser triangulation and light-sectioning). In harsh processes such as welding or hot-metal production, pulsed laser

illumination can materially improve image contrast versus conventional lighting.
