Heated Tobacco Product (HTPs) uses an electric heating element to produce a smoke that contains nicotine, tar, other chemicals, and particulates. These products may match some of the behavioral aspects of conventional smoking. Tobacco companies claim these products are less harmful to consumers than other types of cigarettes, but 'there is no evidence to demonstrate that HTPs are less harmful than conventional tobacco products', according to the World Health Organization.

There are products that take loose-leaf tobacco in a heated chamber; others require product-specific cigarettes. Products heating cigarettes using an external heat source[failed verification] first came to market in 1988, however they were not a commercial success. These products are being introduced by large tobacco companies.
